

MINOR INFLUENZA VACCINE QUAD *Diversified Solutions*

CONSENT: I have had the opportunity to review the VIS form. I have read the information on this form and I have had a chance to ask questions which were answered to my satisfaction. I believe I understand the benefits and risks of the influenza vaccine and I request the vaccine be given to me. I agree to pay any costs not paid by my insurance for this vaccine. I also provide consent for emergency care to be provided to me per MD protocol in the case of an Adverse Event.

Influenza Virus Vaccine is a (IIV4) quadrivalent vaccine indicated for immunization against the types of flu that have been circulating in the past year and/or thought to be most likely to occur in the United States this flu season. It is not effective against all possible strains of influenza virus. High priority groups for vaccination include those potentially capable of nosocomial transmission of influenza to high risk persons. This includes all medical personnel and volunteers working in healthcare facilities.

WARNING: SOME PEOPLE SHOULD CHECK WITH A DOCTOR BEFORE TAKING INFLUENZA VACCINE:

- Persons who should not be given the flu shot include those with an allergy to eggs that causes dangerous reactions if they eat eggs.
- Anyone who has ever been paralyzed with Guillain-Barre' Syndrome should seek advice from their doctor about special risks that might exist in their cases.
- Women who are or might be pregnant should consult their doctor.
- Persons who are ill and have a fever should delay vaccination until the fever and other temporary symptoms have gone.
- Persons who have had an allergic response to this product in the past.
- Adverse reaction to mercury and/or thimerosal (e.g. mercury in tooth fillings, or thimerosal in contact lens cleaning solutions.)

POSSIBLE SIDE EFFECTS FROM THE VACCINE:

Most people have had no side effects from recent influenza vaccines. Flu shots are given by injection, usually into a muscle of the upper arm. This may cause soreness for a day or two at the injection site and occasionally may also cause a fever or achiness for one or two days. Unlike the 1976 swine flu vaccine, recent flu shots have not been clearly linked to the paralytic illness Guillain-Bare' Syndrome. As is the case with most drugs or vaccines, there is a possibility that allergic or more serious reactions, or even death, could occur with the flu shot.

REACTIONS:

If anyone receiving influenza vaccine gets sick and visits a doctor, hospital, or clinic in the 4 weeks after vaccination please report this to the Vaccine Adverse Event Reporting System at 1-800-822-7967.
